Risk Management Plan for Sprint 8

FIA Cybersecurity App for Women

Context and Objectives

Sprint 8 focuses on strengthening reliability, security, usability, and oversight as the FIA app moves closer to pilot readiness. Key areas this sprint include badge tracking and rewards, University Admin and Super Admin audit visibility, admin workflow polish, sensitive data protection, mobile optimization for WebForms, and updated documentation for the current build.

This plan identifies the highest risk areas for Sprint 8 work, how we will detect issues early, and how we will respond if new risks emerge during implementation and testing.

Sprint 8 Focus Areas

- Badge tracking and rewards (planning, design, awarding, and viewing)
- Admin audit logging pages and a progress question workflow
- University Admin and Super Admin UI polish and targeted bug fixes
- Security pass through for sensitive data and secure storage practices
- Mobile WebForms optimization using mobile-only overrides
- Application Use Guide screenshot refresh and accuracy validation

Risk Identification and Assessment

Risk	Impact and Likelihood	Mitigation
Badge awarding is incorrect or inconsistent across roles	High impact; medium likelihood. Incorrect rewards reduce trust and make progress feel unreliable.	Centralize badge criteria and awarding checks, award from real tracked events, and add tests for earn, not earn, and no duplicates.
Admin views show confusing or incomplete audit history	Medium to high impact; medium likelihood. Admins may not be able to explain outcomes or investigate issues clearly.	Standardize log fields and messages, add filters for key event types and date ranges, and validate log readability with real scenarios.
Sensitive data is stored or logged in plaintext	High impact; low to medium likelihood. This is not acceptable for real users and blocks readiness.	Define sensitive fields, audit storage and logs, implement hashing for passwords and other sensitive values, and update all reads and writes to use hashed storage.
Mobile optimizations accidentally change desktop layouts	Medium impact; medium likelihood. Desktop polish regressions are visible and costly to fix late.	Keep all mobile changes inside media queries, scope overrides to page wrappers when needed, and compare desktop screenshots before and after merges.

Unexpected Risks and Challenges in Sprint 8

1. Coordinating badge logic, badge display, and admin review behavior across multiple roles took more cross-checking than expected.

Because badges affect Participants, Helpers, home screens, admin oversight, and future reporting, even a small mismatch in criteria or timing could make the feature feel unreliable. We managed this by keeping badge criteria small and clear, checking that awarding came from real tracked events, and reviewing how badge updates appeared in the UI and logs together.

2. Securing sensitive data touched more code paths than expected.

Once we reviewed storage, login, profile, and logging flows together, it became clear that plaintext handling could appear in more than one place. We reduced this risk by creating a short sensitive data list first, using one shared hashing approach, and rechecking the related read and write paths after each change.

Weekly Risk Reviews Summary

Week of March 2, 2026

What we review each week:

- Badge criteria clarity, awarding correctness, and duplicate prevention
- Admin log completeness, readability, and traceability of progress review actions
- UI consistency and workflow stability on University Admin and Super Admin pages
- Security checks for plaintext storage, hashing coverage, and sensitive logging
- Mobile usability on common phone screen sizes without desktop impact

How we keep risks visible:

- Track risk items in Taiga and update the RiskManagement file in GitHub as changes land
- Use a short regression checklist before merging UI, workflow, security, or mobile changes
- Call out any new risk signals during standups and add them as follow-up items immediately

Top Risks This Sprint

<u>1. Sensitive data exposure through storage or logs</u>

<u>2. Badge awarding correctness and duplicate prevention</u>

<u>3. Admin audit visibility and safe progress review actions</u>

Notes for Sprint Close

- Run a final end to end walkthrough for Participant, Helper, University Admin, and Super Admin flows.
- Verify badges: earn, not earn, duplicate prevention, and locked state hints on both home screens.
- Confirm audit logs are scannable and filters work for date range and event type.
- Re-scan storage and logs to confirm sensitive fields are not present in plaintext.
- Validate mobile usability on key pages and confirm desktop layouts remain unchanged.
- Refresh any changed screenshots in the Application Use Guide using seeded demo data.
